

131st NGAUS GENERAL CONFERENCE

RESOLUTION – J #7

RELATING TO MEDICAL INFORMATION MANAGEMENT IN THE NATIONAL GUARD

Recommendation

To ensure proper tracking of medical records, the National Guard Association of the United States supports:

- A. To ensure continuity of care, establish a medical information management system with self-contained wireless capability that will allow access and integration compatibility between the National Guard, Department of Defense, Veterans Administration (VA), and civilian health care providers
- B. Establish a Medical Information Management System (MIMS) that can be used for managing medical information of deployed National Guard and Reserve Soldiers, mass casualties, and day-to-day clinic operations, with funds made available in the Army budget for the Army National Guard
- C. Digitize records to ensure medical information management systems are compatible among the active and reserve components, the VA and civilian health care providers to facilitate the full exchange of health-related medical information as the service member transitions through active service to either retired or civilian status
